(54) AMINO-PYRIDINES AS COUPLING COMPONENTS FOR AZO DYES

We, B.A.S.F. AKTIENGESELLSCHAFT a German Joint Stock Com-(71)pany of 6700 Ludwigshafen, Federal Republic of Germany, formerly Badische Anilin-& Soda-Fabrik Aktiengesellschaft, do hereby declare the invention, for which we pray that a Patent may be granted to us, and the method by which it is to be performed, to be particularly described in and by the following Statement:—

The present invention relates to amino-pyridines of the formula

in which

X is CN or CONH₂;

 R^1 is H, C_2 to C_7 alkyl or phenyl; one Q is NHR; and the other is Cl, NH2 or NHR;

where R denotes or each R independently denotes a substituted or unsubstituted hydrocarbon radical;

and also to amino-pyridines of the same formula, in which R1 is methyl;

X and one Q can denote any of the values specified above for X and Q respectively, and the other Q is NHR4;

where R4 is

an alkyl group of more than 8 carbon atoms; a)

b) a 5-hydroxy-1,5-dimethyl-hexyl group;

c) an optionally hydroxy-substituted aralkyl group with 3 or 4 carbon atoms in 20 the alkyl chain;

a (CH₂) m N group where m is from 4 to 6;

a cyanoalkyl group; or

a hydrocarbon or substituted hydrocarbon group which,

(i) is or contains a cycloalkyl, polycycloalkyl, cycloalkenyl or polycyclo-25 alkenyl group containing 5 or from 7 to 12 carbon atoms

is or contains a cycloalkyl or polycycloalkyl group which bears chloro, alkyl, hydroxyalkyl, chloroalkyl or hydroxyethoxy as a substituent;

(iii) contains as a substituent an aralkoxy or cycloalkyloxy group;

contains at least two OC₂H₄ groups and in all at least 3 ether oxygen 30 atoms; or

(v) is a derivative (other than an acyl derivative) of, or contains as a substituent a methyl-substituted oxyethylene group. These amino pyri-

dines are intermediates for azo dyes. The phrase "contains as a substituent" as applied

[Price 33p]

to a substituted or unsubstituted hydrocarbon group includes the case where the substituent is a secondary substituent: e.g. class f(iii) above includes the radical (CH₂)₃OC₂H₄O-cyclohexyl. The invention also relates to mixtures in any proportion of compounds as specified 5 with the isomeric compounds in which the two Q's are interchanged. 5 Examples of alkyl radicals R¹ are ethyl, n-propyl, isopropyl, butyl, pentyl, α-ethylpentyl and preferably methyl. Examples of radicals R are alkyl of one to eight carbon atoms which may be interrupted by oxygen atoms and which may bear hydroxy, alkoxy, cyano, cycloalkoxy, 10 aralkoxy or aroxy as substituents, cycloalkyl and polycycloalkyl which may bear 10 hydroxy, chloro, hydroxyalkyl, chloroalkyl or alkyl as substituents, aralkyl of seven to fifteen carbon atoms, phenyl which may bear chloro, hydroxy, alkoxy, alkyl, hydroxyalkoxy or hydroxyalkyl as substituents, or alkenyl, pyrrolidonylalkyl or carboxyalkyl. Examples of individual radicals R are: 15 (1) unsubstituted or substituted alkyl: 15 CH_3 $n-C_3H_7$ C_2H_5 i— C_3H_7 , $n-C_4H_9$ C₄H₉ CH_2 — $\dot{C}H$, \dot{C}_2H_5 CH₂CH₂OH, $(CH_2)_3OH$, CH₂CHOH, CH-CH₂OH, CH₃ CH₃ 20 $(CH₂)_{\bullet}OH$, $(CH_2)_6OH$ 20 $CH-(CH_2)_3C(CH_3)_2$, CH₃ ÒН $(CH_2)_2O(CH_2)_2OH$, $(CH_2)_3O(CH_2)_4OH$, $(CH_2)_3OC_2H_4OH_3$ (CH₂)₃OC₂H₄OCH₃, (CH₂)₃OC₂H₄OC₂H₅,(CH₂)₃OC₂H₄OCH(CH₃)₂,(CH₂)₃OC₂H₄OC₄H₉, $(CH_2)_3OC_2H_4OCH_2C_6H_5$ (CH₂)₃OC₂H₄OC₂H₄C₆H₅, $(CH_2)_3 - OC_2H_4CC_H$, $(CH_2)_3OC_2H_4OC_6H_5$, $(CH_2)_3OCH_4CH_2OCH_3$, 25 25 ĊH, (CH₂)₃OCHCH₂OC₄H₅, (CH₂)₃OCH₂CH—OCH₃, (CH₂)₃OCHCH₂OC₂H₅, ĊH3 ĊНз corresponding radicals in which the groupings —OC₂H₄—, are present twice, three times or four times, **3**0 CH₂CH₂OCH₃, CH₂CH₂OC₂H₅, CH₂CH₂OC₃H₇, CH₂CH₂OC₄H₉, 30 CH₂CH₂OC₆H₅, (CH₂)₃OCH₃, $(CH_2)_3OC_2H_{59}$ $(CH_2)_3OC_3H_{79}$ (CH₂)₃OC₄H₉, $(CH_2)_3OCH_2CHC_4H_9$, $(CH_2)_3OC_6H_{13}$, $(CH_2)_3OC_8H_{17}$,

                                                                                                                                                                                                                                                                                                                              25
```

Y is chloro, NH2 or a radical of the formula NHR, and X, R and R¹ have the meanings given above, with the proviso that either R1 denotes hydrogen, phenyl or C2 to C7 alkyl, or at least one R has a value given above for R4. 5 Reaction conditions which affect the exchange of the chlorine atom(s) include the 5 temperature, the amine component, the molar ratio of the reactants and any diluent or solvent or acid-binding agent used. Amines of low boiling point may of course be reacted under superatmospheric pressure. The reaction with the amine is conveniently carried out at elevated temperature, a temperature of from 0° to 110°C being adequate 10 for the exchange of the first chlorine atom depending on the basicity of the amine, 10 while temperatures in the range from 60° to 180°C being advantageous for exchange of the second chlorine atom. Amines of high basicity react more rapidly than those of low basicity; when exchanging the second chlorine atom it is advantageous to use stoichiometric excess of 15 amine (more than 10%), whereas the first chlorine atom reacts immediately with a 15 molar amount of amine. Examples of suitable diluents or solvents which may be added are alcohols such as methanol, ethanol or isopropanol, glycols and glycol ethers such as methyl glycol, ethyl glycol or butyl glycol, hydrocarbons and halohydrocarbons such as benzene, toluene, ethylene chloride, chloroform, trichloroethylene or chlorobenzene, and also acetone, tetrahydrofuran, dimethylformamide, N-methylpyrrolidone or dimethyl-**2**0 20 sulphoxide. The presence of water does not cause any disturbance. The addition of acid-binding agents is advantageous because then the total amount of amine to be reacted is available for the exchange. Substances which do not themselves react with the chloropyridine derivatives are suitable as acid-binding agents; for example tertiary amines such as triethylamine, tributylamine, triethanolamine, ethyldi-25 25 isopropylamine, caustic soda solution, sodium carbonate, magnesium oxide or calcium carbonate are suitable. In the case of inexpensive amines, an excess of the amine to be reacted may also serve as acid-binding agent. Compounds of the formula (Ia): RHN CN (Ia) 30 30 in which R has the meanings given above (at least one R having a value specified above for R⁴) are of particular industrial significance. Examples of preferred radicals R containing oxygen are: CH₂CH₂OH, CH₂CH₂CH₂OH, CH₂CHOH, CH—CH₂OH, ĊH₃ CH₃ 35 $(CH_2)_3O(CH_2)_2OH$, $(CH_2)_3O(CH_2)_4OH$, $(CH_2)_3O(CH_2)_6OH$, 35 $(CH_2)_4OH$, $(CH_2)_6OH$, $(CH_2)_2O(CH_2)_2OH$, $CH(CH_2)_3C(CH_3)_2$, CH₃ ÒН -(H)-ОСН2СН2ОН СН2-(H)-СН2ОН, Т()-ОН, -{Н}- он CH₂CH₂OCH₃, CH₂CH₂OC₂H₅, $CH_2CH_2OC_4H_9$, $(CH_2)_3OCH_3$, $(CH_2)_3OC_2H_5$, $(CH_2)_3OC_3H_7$, $(CH_2)_3OC_4H_9$, 40 40 $(CH_2)_3OC_6H_{13}$ $(CH_2)_3OC_8H_{17}$ (CH₂)₃-0-(H), (CH₂)₃OCH₂-0, (CH₂)₃0C₂H₄-(CH₂)₃0-0,

Examples of preferred oxygen-free radicals R are:

$$C_{2}H_{5}$$
, $C_{3}H_{7}$, $C_{4}H_{9}$,

 H , O , O ,

 $CH_{2}C_{6}H_{5}$, $C_{2}H_{4}C_{6}H_{5}$, $C_{3}H_{6}C_{6}H_{5}$,

 $CH_{2}-CH-C_{6}H_{5}$, $C_{6}H_{5}$, $C_{6}H_{4}CH_{3}$.

The new coupling components are outstandingly suitable for the production of azo dyes by reaction with diazotized amines. The dyes which can be obtained in this way are distinguished by excellent fastness properties and by an unusual brilliance for azo dyes.

The following Examples illustrate the invention, Examples 2, 33, 35, 36, 43, 46 and 57 to 183 relating to the preparation of compounds according to the invention, and Examples 1, 3 to 32, 34, 37 to 42, 44, 45 and 47 to 56 relating to the preparation of intermediates, which, by reaction with an amine of the formula R⁴NH₂ will yield compounds according to the invention. Parts and percentages referred to are by weight unless otherwise stated, and parts by volume stand in the same relationship to parts by weight as does the ml to the g.

Example 1.

187 parts of 2,6-dichloro-3-cyano-4-methylpyridine is suspended in 500 parts by volume of methanol. 80 parts of 2-hydroxyethylamine is then added at 40° to 45°C followed by 100 parts of triethylamine. The mixture is stirred for five to six hours at 45° to 50°C, about 250 parts by volume of methanol is distilled off and the residue is diluted with 1000 parts by volume of water. After acidification with 50 parts of concentrated hydrochloric acid, the whole is stirred for one hour, the deposited precipitate is filtered off, washed with water until neutral and dried. About 210 parts of a colour-less powder of the formula:

is obtained. The powder contains a smaller amount of a product of the formula:

The mixture melts at 115° to 120°C.

Example 2.

A suspension of 50 parts by volume of methanol, 22 parts of norbornylamine, 37 parts of 2,6-dichloro-3-cyano-4-methylpyridine and 25 parts of triethylamine is stirred for six hours at 40° to 50°C. Then about 200 parts by volume of ice-water is added, the whole acidified to pH 1, the precipitated product of the formula

10

15

20

35

(which still contains a small proportion of 2-chloro-3-cyano-4-methyl-6-norbornyl-aminopyridine isomers) is filtered off, washed with water and dried. About 45 parts of a colourless powder is obtained which melts at 110° to 112°C.

45 parts of the moist powder is heated at 130° to 140°C with 50 parts of the amine of the formula:

H₂N—CH₂—CH₂—O—CH₂—CH₂—OH

5

10

15

25

35

the water being allowed to evaporate. After stirring for five hours at 130° to 140°C the reaction is completed. The whole is allowed to cool and is acidified with 130 parts by volume of acetic acid. A solution of the coupling component mixture of the formulae:

the amount of the product of the formula (B) being small.

When the mixture thus obtained is coupled with p-nitroaniline a dye is obtained which dissolves in dimethylformamide to give an orange solution.

Example 3.

A mixture of 300 parts by volume of N-methylpyrrolidone, 150 parts of 2,6-dichloro-3-cyano-4-methylpyridine, 115 parts of p-anisidine and 90 parts of triethylamine is stirred for from six to seven hours at 70°C. It is then poured while stirring onto 1500 parts of ice-water and acidified with hydrochloric acid to pH 1. About 220 parts of a colourless product of the formula:

C1 NH OCH3

is obtained which is isolated by filtration, washing with water and drying. The powder contains a minor amount of a product of the formula:

The mixture melts at 147° to 150°C.

Example 4.

50 parts of 2,6-dichloro-3-carbamoyl-4-methylpyridine is stirred with 75 parts of propanolamine-1,3 for ten hours at 90°C. The mixture is precipitated with water and acidified to pH <0. The insoluble residue is filtered off, washed with water and dried. The colourless powder melts at 210°C and probably has the formula (C):

The filtrate has caustic soda solution added to it until the pH is from 5 to 6. A crystalline precipitate is thrown down which probably has the formula (D)

This is filtered off, washed with water and dried. The product (D) thus obtained also contains traces of the product of the formula (C) and melts at 150° to 160°C.

If the reaction mixture is precipitated at pH from 6 to 7, a mixture of the two isomers is obtained which has a melting point of about 143°C.

When 2,6-dichloro-3-carbamoyl-4-methylpyridine is treated with other amines

analogously to the method described in Example 4, mixtures of substituted 2-amino-pyridines and 6-aminopyridines are obtained, the amount of 2-amino-3-carbamoyl-4-methyl-6-chloropyridine derivatives being only slightly greater than that of the 6-amino-pyridine isomers in question.

The physical properties given in Table 1 (which lists some compounds which may be prepared as mentioned above) relate to mixtures of the compounds indicated with their isomers in which Cl and NHR are interchanged.

When 2,6-dichloro-3-cyano-4-methylpyridine is treated with other amines by a method analogous to those described in Examples 1 to 3, there are obtained (by exchange of one chlorine atom) mixtures of 2-amino-6-chloro- and 2-chloro-6-amino-3-cyano-4-methylpyridine derivatives, the proportion of the 2-chloro-3-cyano-4-methyl-6-amino isomers as a rule being noticeably less. The physical properties given in Table 2 (which lists some compounds which may be prepared as mentioned above) relate to mixtures of the compounds indicated with their isomers in which Cl and NHR are interchanged.

When the products set out in Tables 1 and 2 are treated with aliphatic or aromatic amines at temperatures above 100° or 80°C respectively, the corresponding coupling products of formula (I) are obtained.

In the case of pyridine derivatives which contain a carbamoyl group the reaction has to be carried out however at the lowest possible temperature because otherwise hydrolysis and/or decarboxylation of the —CONH₂ group may take place.

The following tables illustrate the products which may be obtained by methods

The following tables illustrate the products which may be obtained by methods hereinbefore described. Where the 2-substituent and the 6-substituent in the product are not the same the physical properties in each case relate to a mixture of the compound indicated with its isomer in which the 2- and 6-substituents are interchanged.

WHAT WE CLAIM IS:—

1. An amino-pyridine of the formula

in which R¹ is H, C₂ to C₇ alkyl or phenyl; 5 X is CN or CONH2; and one Q is NHR; and the other is Cl, NH2 or NHR; where R denotes, or each R independently denotes, a substituted or unsubstituted hydrocarbon radical. 2. An amino-pyridine of the formula 10 10 in which R¹ is methyl; X and one Q can denote any value specified in claim 1 for X and Q respectively; and the other Q is NHR⁴; 15 15 where R4 is an alkyl group of mere than 8 carbon atoms; a 5-hydroxyl-1,5-dimethyl-hexyl group; an optionally hydroxy-substituted aralkyl group with 3 or 4 carbon atoms in 20 the alkyl chain; 20 group where m is from 4 to 6; a cyanoalkyl group; or a hydrocarbon or substituted hydrocarbon group which, (i) is or contains a cycloalkyl, polycycloalkyl, cycloalkenyl or polycyclo-25 alkenyl group containing 5 or from 7 to 12 carbon atoms, 25 is or contains a cycloalkyl or polycycloalkyl group which bears chloro, alkyl, hydroxyalkyl, chloroalkyl or hydroxyethoxy as a substituent; contains as a substituent aralkoxy or cycloalkyloxy group; contains at least two OC2H4 groups and in all at least 3 ether oxygen (iv) 30 atoms; or 30 (v) is a derivative (other than an acyl derivative) of, or contains as a subtuent a methyl-substituted oxyethylene group. 3. An amino-pyridine as claimed in claim 1 or 2 in which both Q's are amino groups. 35 4. An amino-pyridine as claimed in any preceding claim, in which each Q inde-35 pendently is as hereinbefore specifically exemplified. 5. An amino-pyridine as claimed in claim 1, 2, 3 or 4 and as disclosed in any of the foregoing Examples 2, 33, 35, 36, 43, 46 or 57 to 183. 6. A process for preparing an amino-pyridine as claimed in claim 1 or 2 wherein NH₃ or one or more primary amines are reacted with a chloro-pyridine of the formula 40 40 \mathbb{R}^{1}

where one Q is chlorine and the other has any of the values specified for Q in the said claim, and X and R1 are as specified in the said claim.

7. A process as claimed in claim 6 wherein a dichloro pyridine of the formula specified therein, is reacted in two stages to form a diamino-pyridine. 8. A process as claimed in claim 6 or 7 wherein the reaction or one stage of the

reaction is carried out substantially as described in any of the foregoing Examples. 9. An amino-pyridine when prepared by a process claimed in claim 6, 7 or 8. J. Y. & G. W. JOHNSON,
Furnival House,
